

EFFECTIVE STUDY SKILLS - Session 3

Creating study environment, Understanding your learning style and creating learning materials

Study environment

Make sure you have enough space to spread your textbooks and notes out.

Make sure you have got enough light.

Make sure your chair is comfortable.

Keep yourself out of computer games and mobiles or any gadgets during the study time.

Ensure water bottle is handy and keep sipping water to feel hydrated and non sleepy.

Learning Materials

Use loads of HEADINGS for main ideas and concepts.

Use subheadings for points within those ideas.

Stick to one point per line.

Underline key words.

You can use numbering to keep yourself organised.

Use abbreviations - and don't worry about using full sentences.

How to identify your learning style?

There are four primary learning styles: visual (learning through images), auditory (learning through sound and speech), reading and writing (learning through written content), and kinaesthetic (learning through direct experiences)

Visual

The visual learning style involves using images to learn. Visual learners take in and retain new information best through sight. They often enjoy learning from visual aids, such as illustrations, charts, maps, and diagrams.

Auditory

The auditory style of learning focuses on sound and speech. Auditory learners take in information best through listening and repeating or discussing the material they are learning. Auditory learners usually enjoy and understand information best through lectures, group discussions, or sound recordings.

Kinesthetic

Learn best by doing something active, such as practicing a skill or constructing something. Interactive learning aids, simulations, and videos can help kinesthetic learners

Reading and writing

Prefer to consume information by reading texts and can absorb more by rephrasing and condensing it. The traditional college textbook and annotation process works well for this style

Interpersonal learners

Work best in groups and social settings, such as debates, group study, and interactions. Social elements can help improve their concentration.

Logical-mathematical learners

Have the ability to think abstractly and recognize patterns. They may prefer to learn big ideas first, using a top-down learning method

Home assignment

Ask the students to take help of their parents and create a learning environment and also make necessary arrangements suitable to their learning styles and note down the difference they find.

Every parent must sent the difference after observing the child's learning styles.

End of session
