

EFFECTIVE STUDY SKILLS - Session 4

Creating learning materials

Tips for auditory learners

Verbally reciting materials

Reading information or study materials out loud can help with understanding and reinforce memory

Listening to recorded lectures or lessons

Auditory learners may find that they retain information better when they hear it as opposed to when they read it, so recordings of lectures or audiobooks can be useful.

Using mnemonic devices

Mnemonic devices are memory techniques that often involve songs, rhymes, or alliteration

Discussing concepts with a group

For auditory learners, discussing concepts can often help with understanding.

Tips for reading and writing learners

Using reading materials.

For reading and writing learners, simply reading or rereading texts or notes can help with both learning new concepts and retaining information.

Taking notes and writing information

Often, the act of writing is sufficient to aid reading/writing learners in memorizing information, regardless of whether they actually review the notes. Some may even find that repeatedly writing down a definition or equation helps them to remember it.

Reading or writing instructions.

When studying for a practical test or exam, reading and writing learners may benefit from reading over instructions or writing their own step-by-step outline for the task.

Revising and rewriting notes

Reading and writing learners may find that revising and reformatting their notes is an effective study habit.

Tips for kinaesthetic learners

Moving while listening to or viewing information

Kinaesthetic learners often find that pacing, playing with a fidget device, or even simply tapping a foot or pencil while reading or listening to information helps them retain it better.

Building models

Model building can be an effective way for kinaesthetic learners to learn concepts and remember details

Experiencing hands-on practice or training

Kinaesthetic learners typically learn best through hands-on experience, whether learning practical skills or a new concept. For example, they might retain a science concept more effectively when a teacher introduces it through an experiment rather than simply explaining it verbally.

Tips for visual learners

Studying diagrams or maps

Visual learners often retain information better from graphic representations rather than through text.

Using colours and pictures when writing notes

When taking notes, visual learners may benefit from colour-coding information, using visually appealing formatting, and adding drawings or diagrams

Organizing information with charts and tables.

Visual learners often benefit from viewing information in a chart or table format.

Activity

Step 1 Ask the students to make a note of their learning style step by step.

Step 2 Give them a general topic and ask them to learn and understand using their learning style.

Step 3 Check the speed of learning and guide them for betterment if needed.

End of session
